Excl. custom fees

For sale: 1x used redundant Virtual Studio Manager servers – Main and Backup

**Virtual Studio Manager Workflow:**

Since the VSM is able to control manufacture-independent all broadcast devices it provides a flexible and powerful one-stop solution for all broadcast challenges. Together with the configuration software vsmStudio the VSM makes a variety of hardware and software front-ends available for an unlimited number of users. That way complete studios, master control rooms and mobile trucks can be equipped and managed with one single system.

The available VSM control system is a medium size control system, where up to 3.072 signal paths along with their parameters can be managed with one single system. In addition, the superordinate control system provides gadget, Tally and GPI/O management. Further VSM functionalities such as Views and Storage Groups, Virtual Signals and Pseudo Devices support the OB Van team before and during the production with quick and easy preparation as well as flexible adaption to the production environment.

In combination with the client application vsmPanel, the VSM control system also provides numerous freely configurable software frontends. This enables exact workflows, which are necessary in the OB van, to be displayed in a well-arranged and user-friendly way.

The load balancing of the redundantly designed multiserver system guarantees availability at the highest level: In case one server fails, another server in the cluster seamlessly takes over its functions. This makes the IP based VSM control system the most flexible and at the same time safest control solution for changing production requirements.
